

# *Constraining $(n,\gamma)$ reaction cross sections for astrophysical applications*

Artemis Spyrou

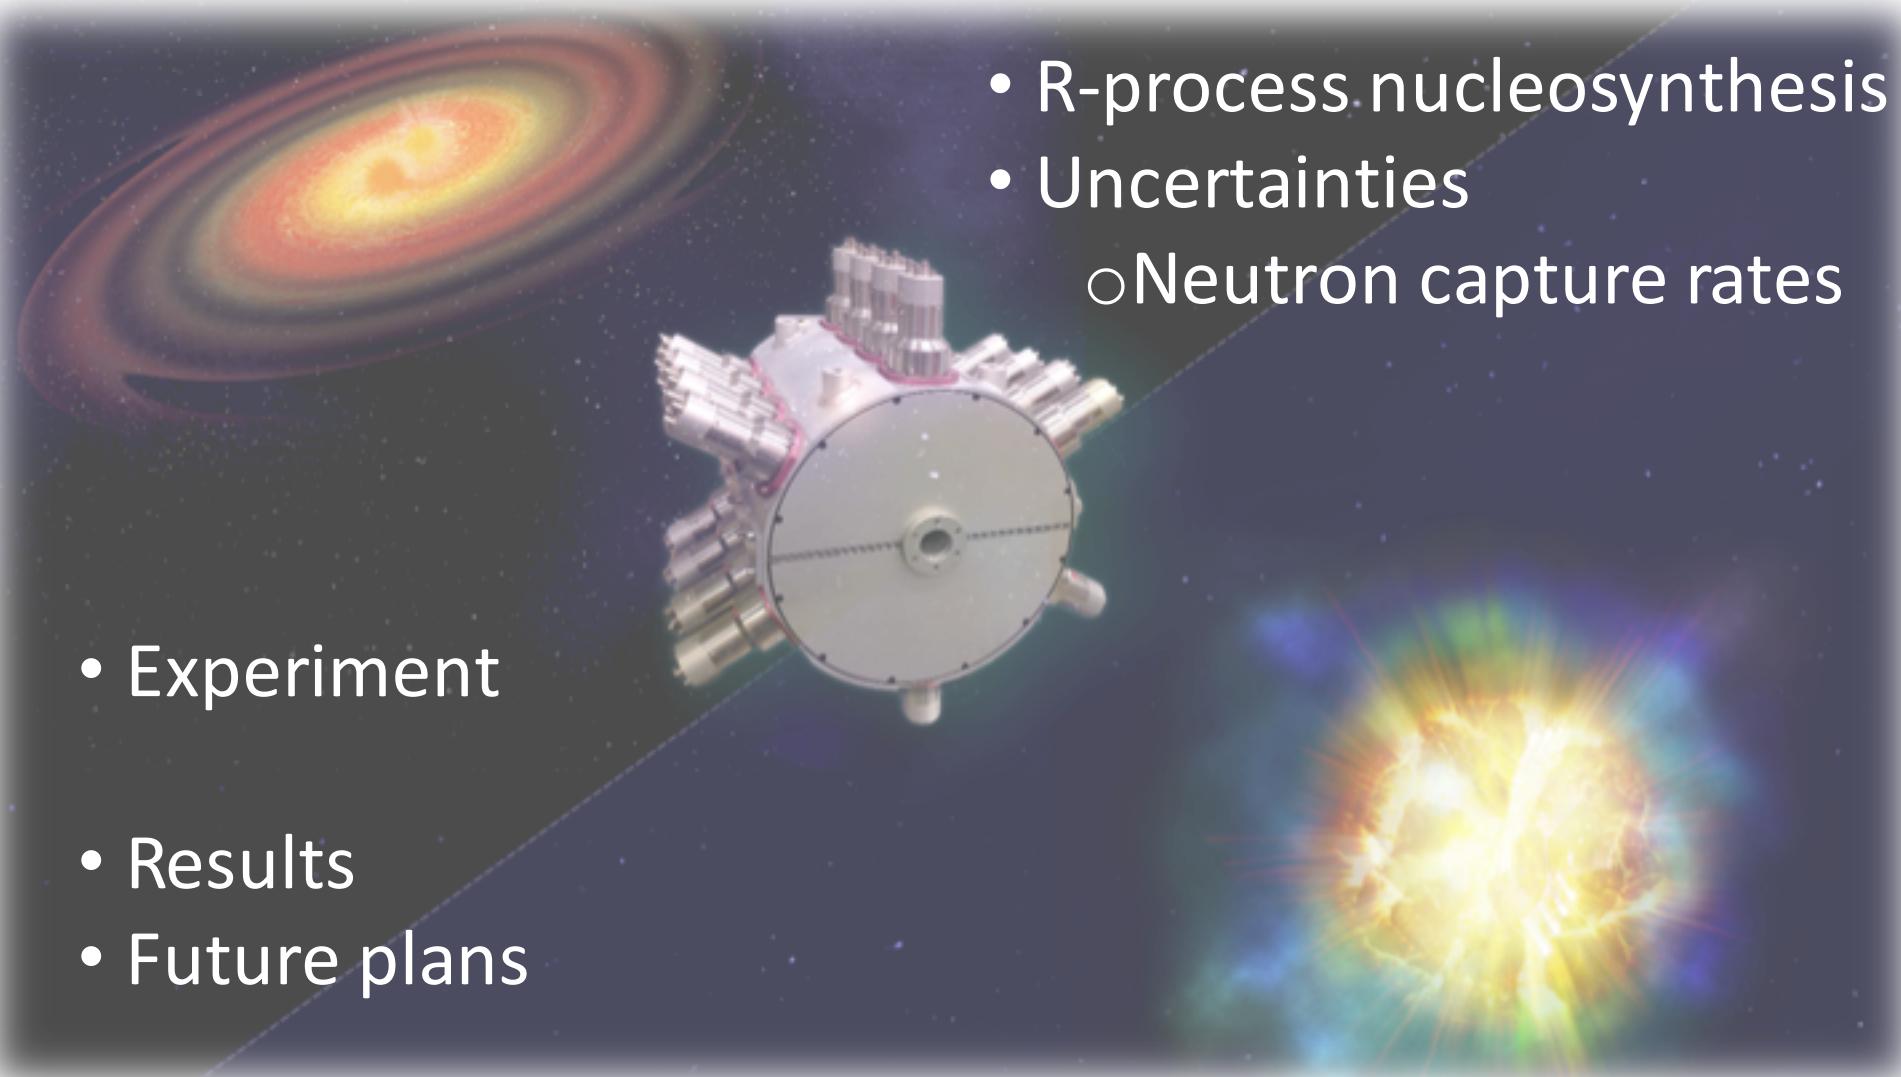

MICHIGAN STATE  
UNIVERSITY

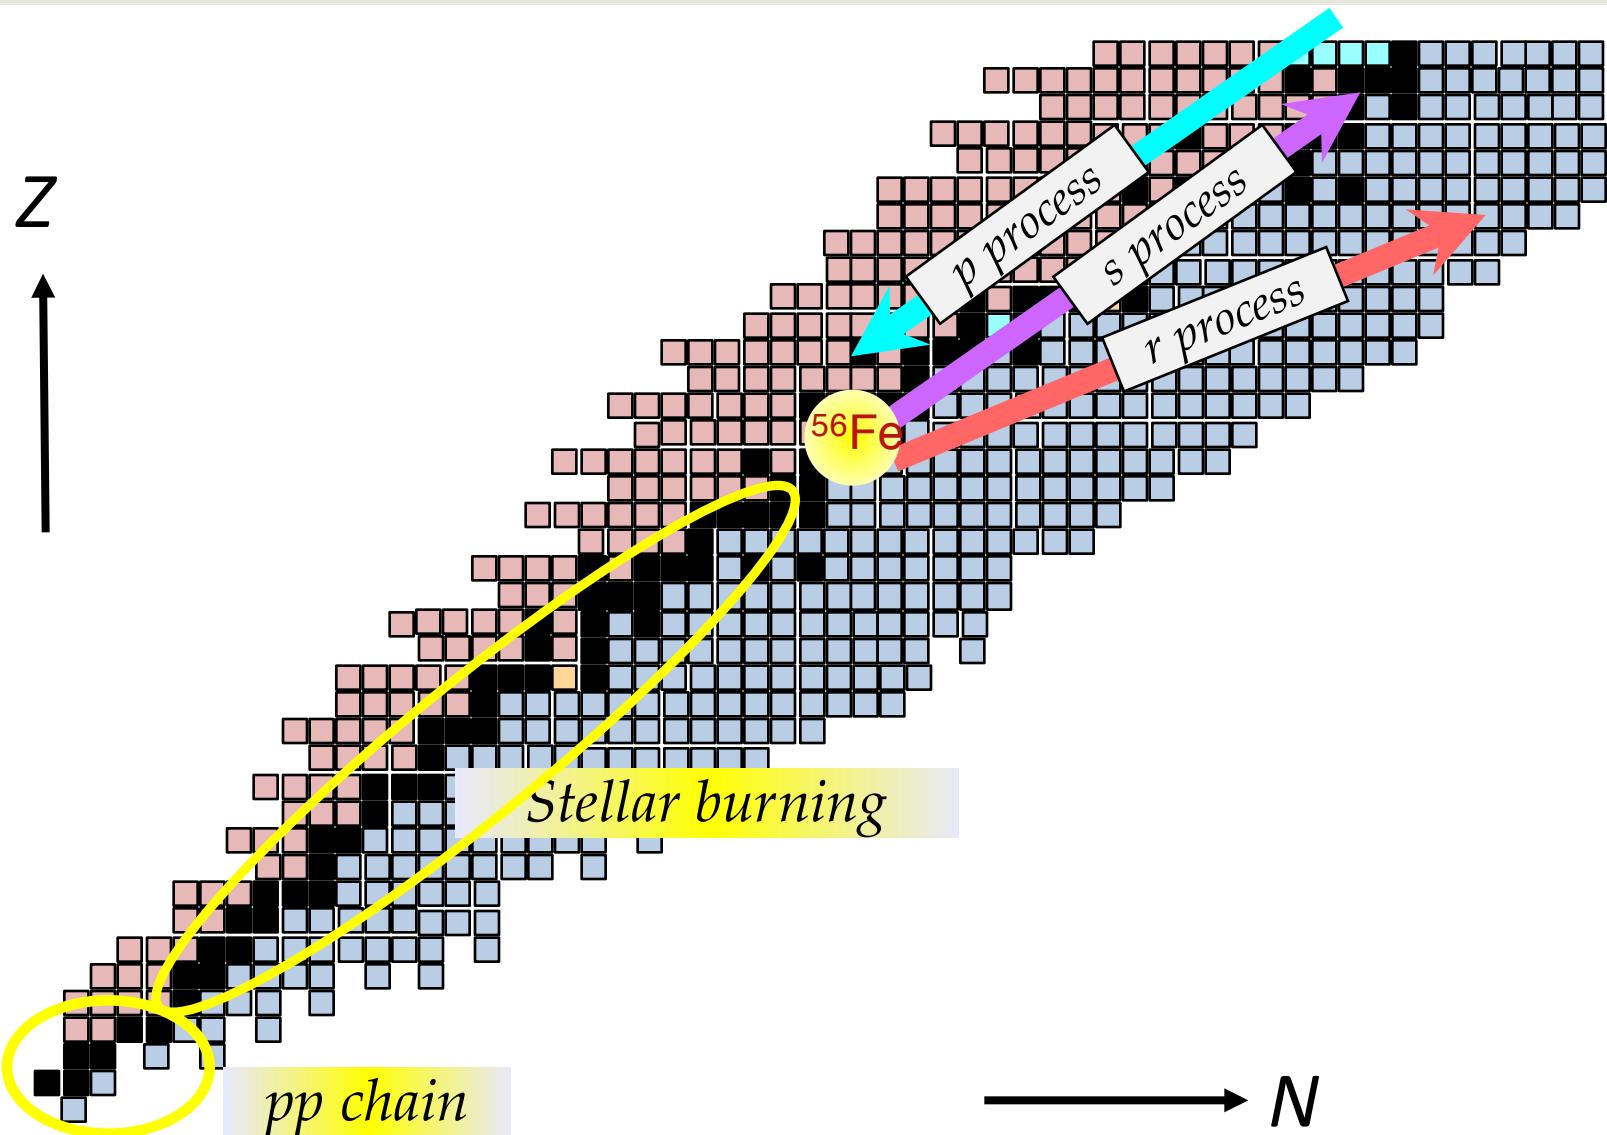

National Science Foundation  
Michigan State University

Artemis Spyrou, COMEX 2015, Slide 1

# Overview

- 
- Experiment
  - Results
  - Future plans
  - R-process nucleosynthesis
  - Uncertainties
    - Neutron capture rates

# Nucleosynthesis paths

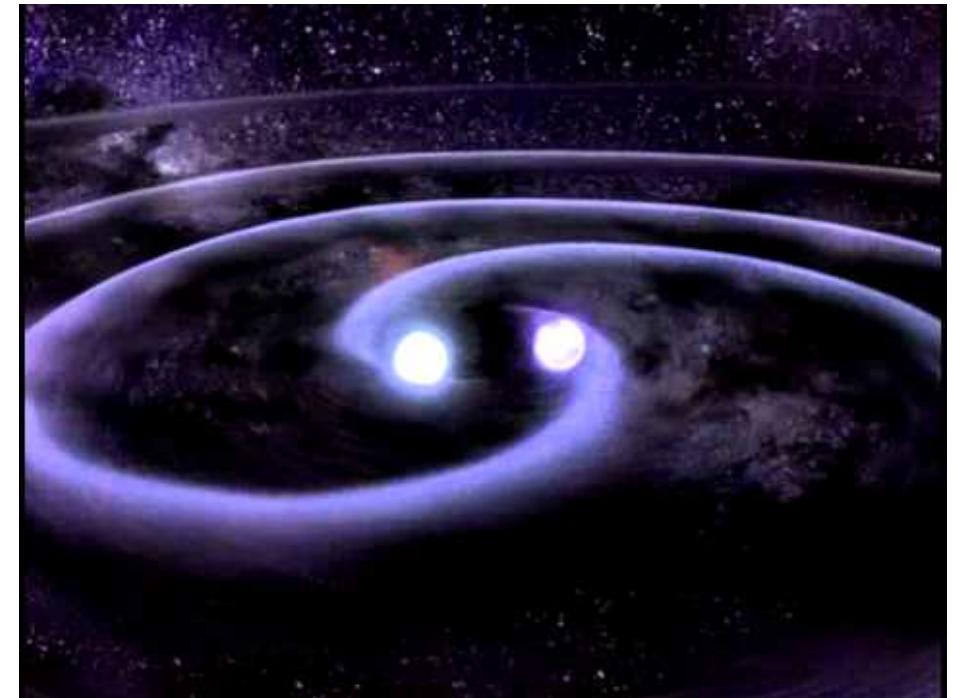

# Open questions: What is the site of the r-process?

Credit: Erin O'Donnell, MSU

Core Collapse Supernova?

Neutron Star Merger?

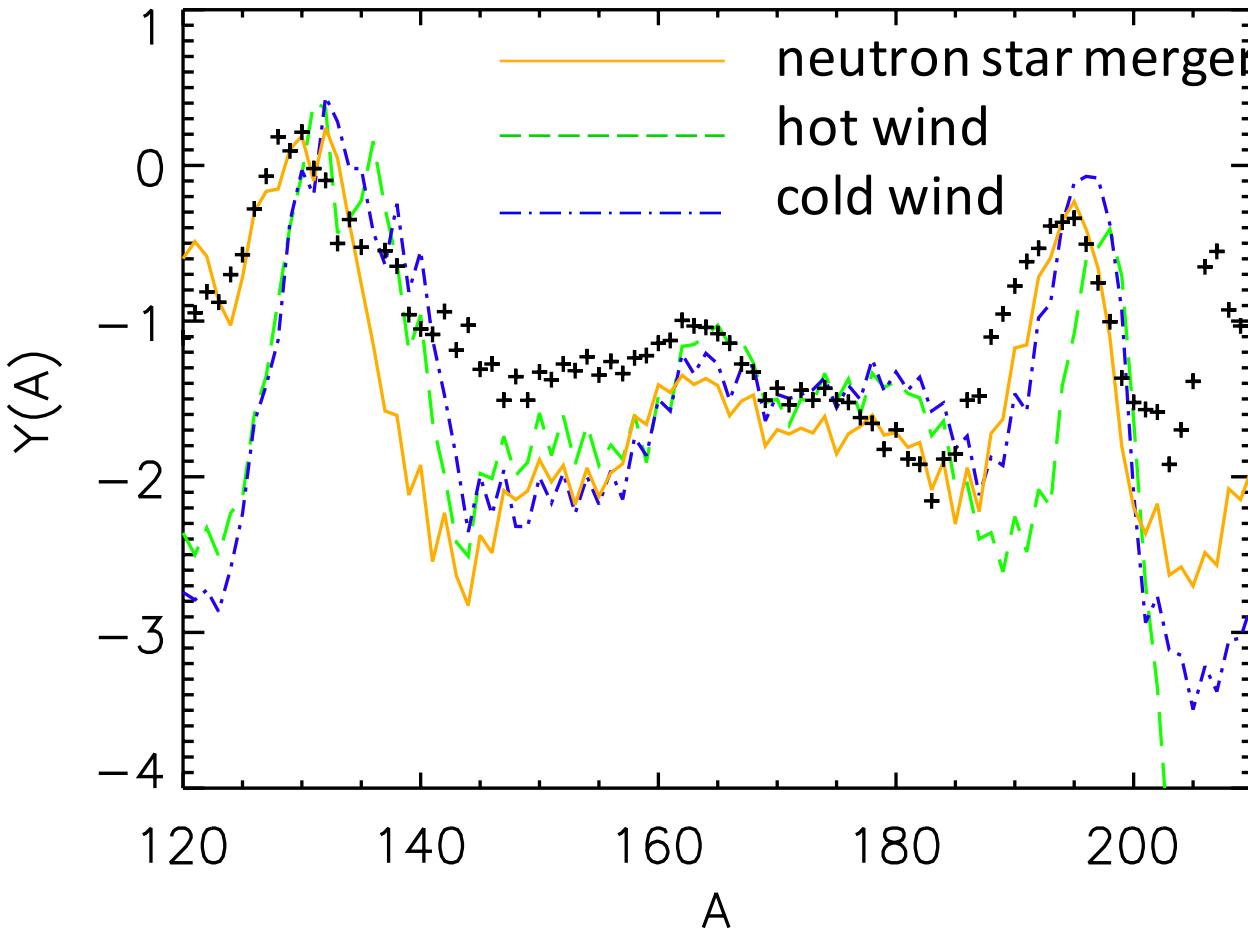

National Science Foundation  
Michigan State University

Credit: NASA Goddard

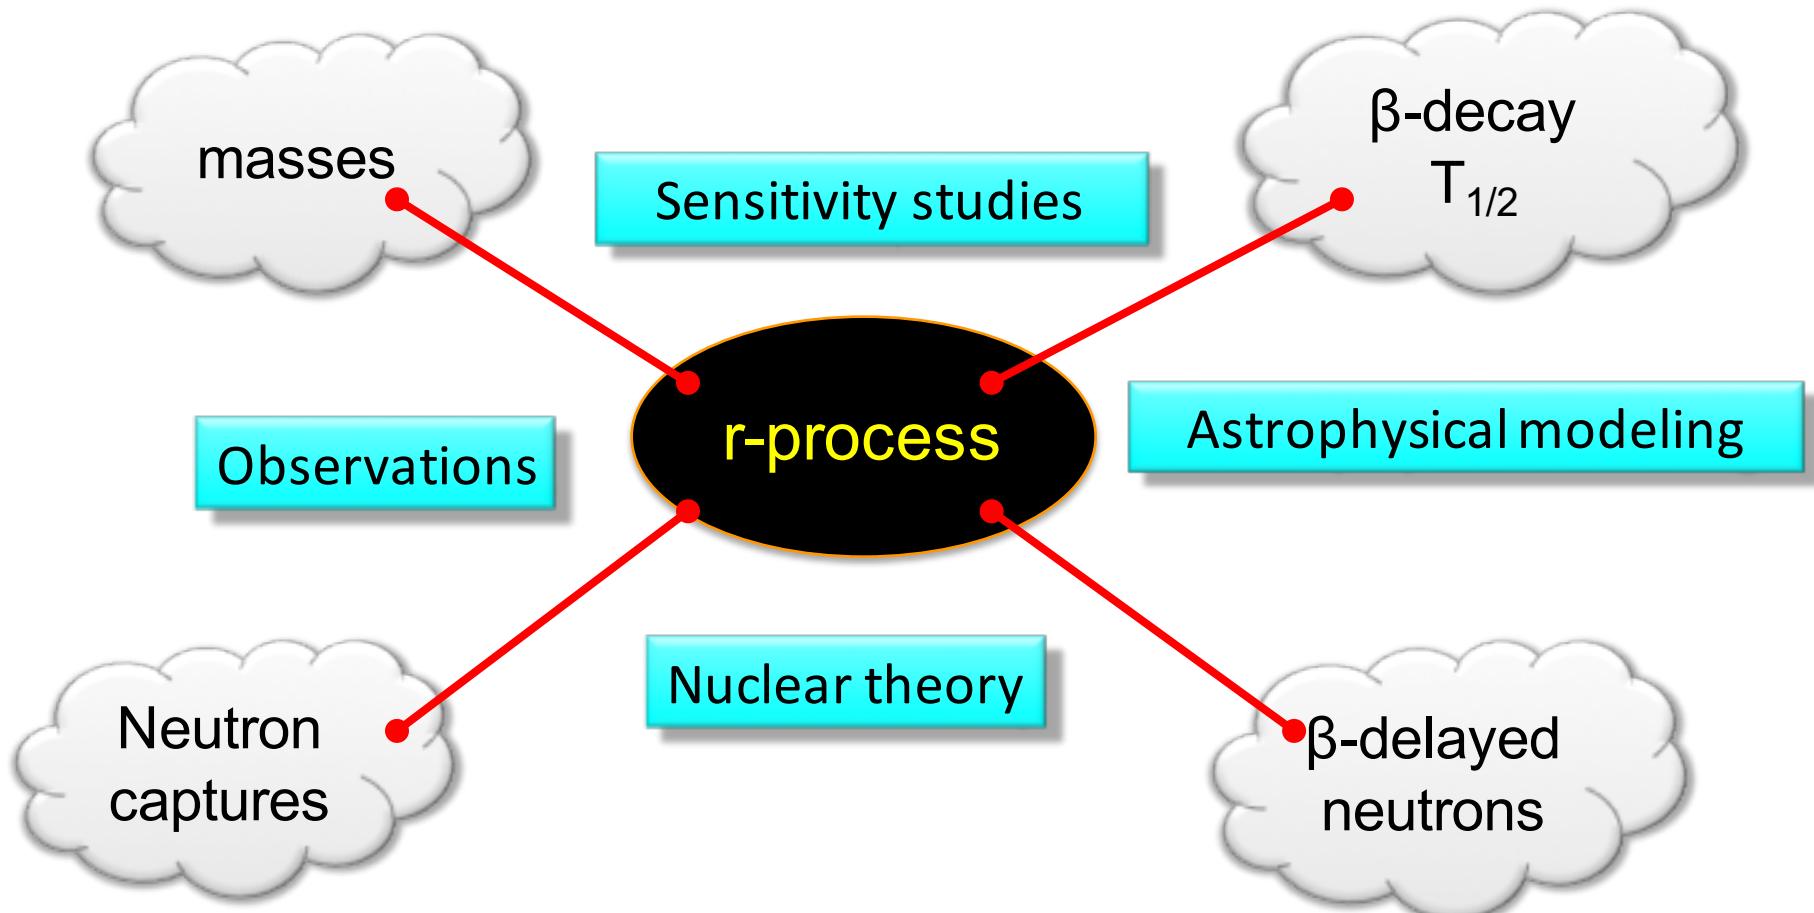

Artemis Spyrou, COMEX 2015, Slide 4

# r-process calculations

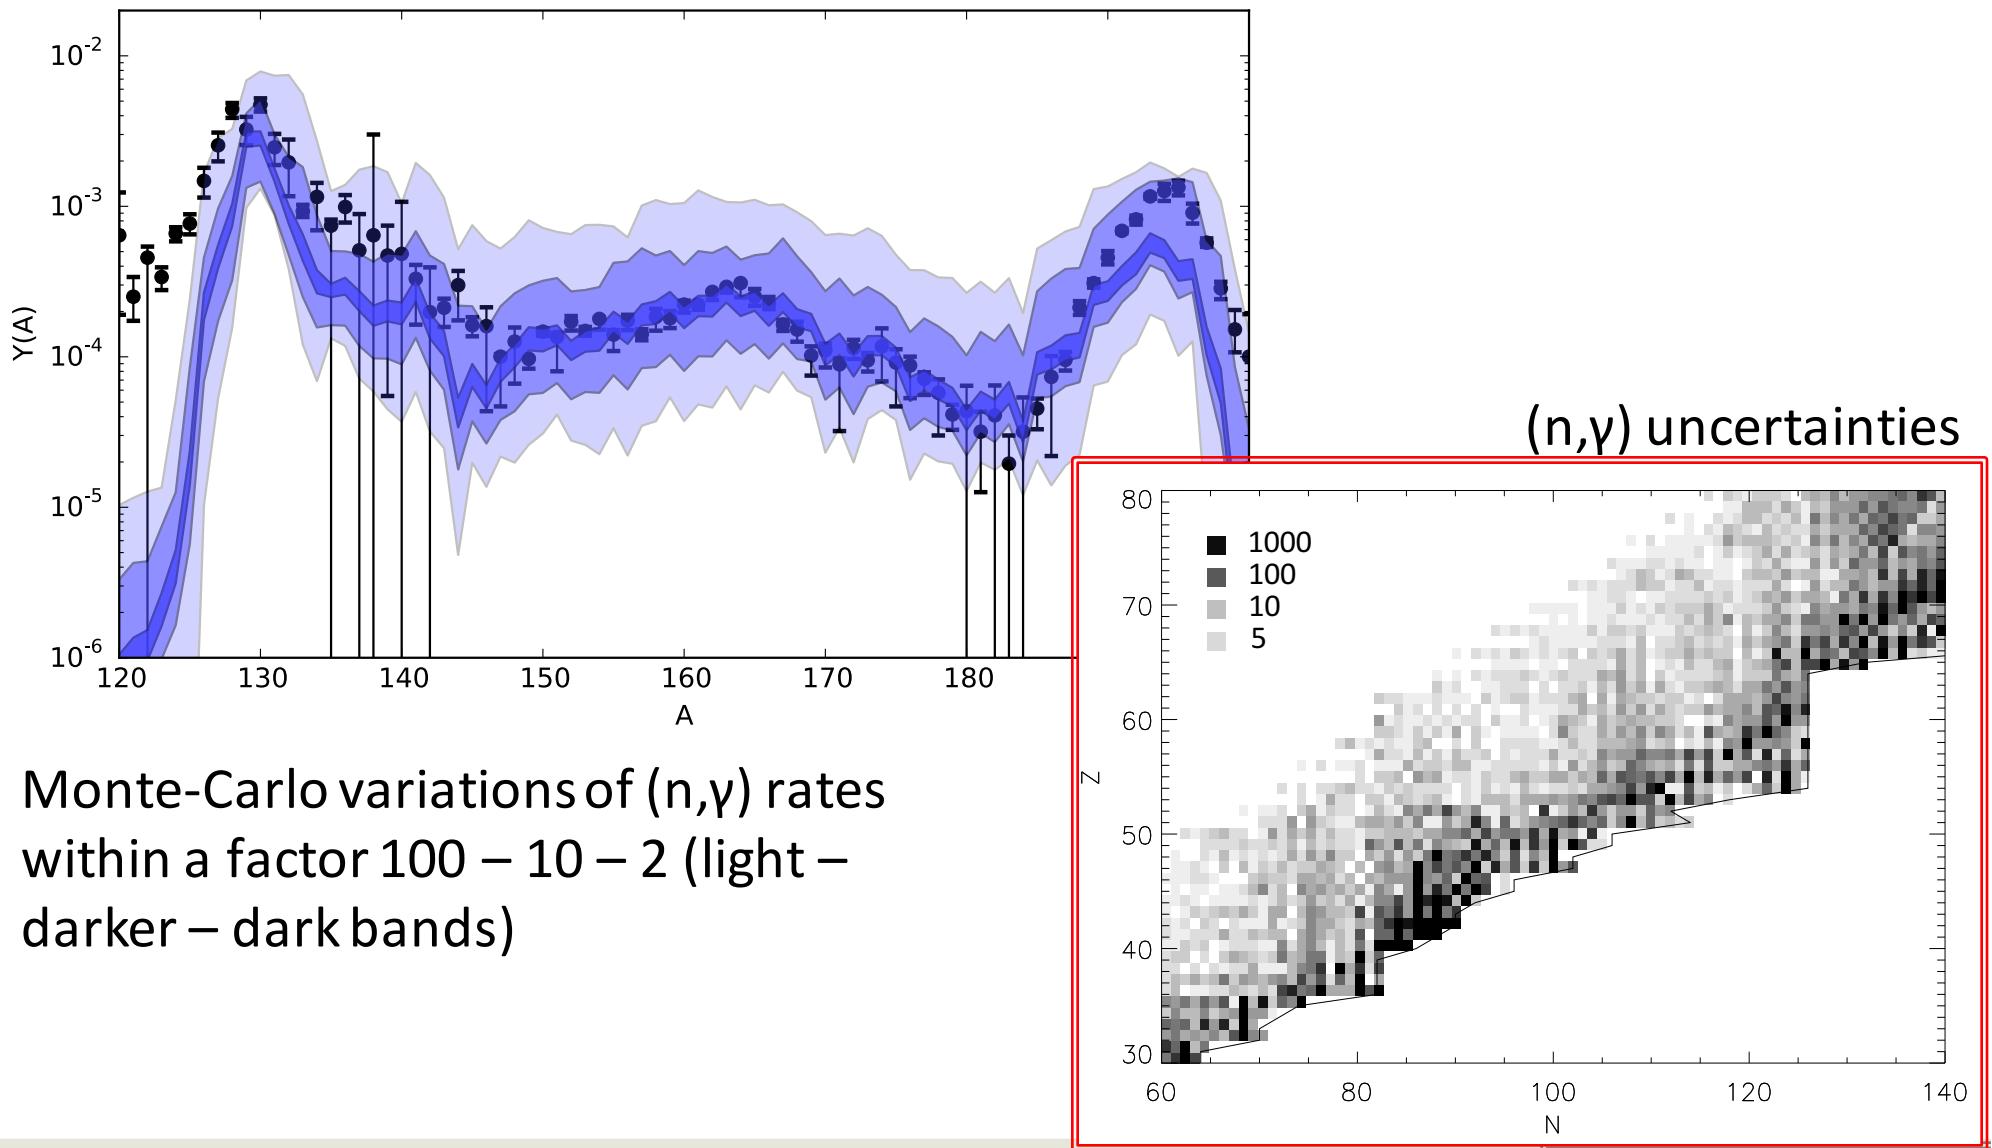

- Abundance pattern is different for the different astrophysical scenarios.
- Does one of them reproduce the observed abundances best?
- Why can't we tell?

# r-process

# Nuclear Physics Uncertainties: $(n,\gamma)$

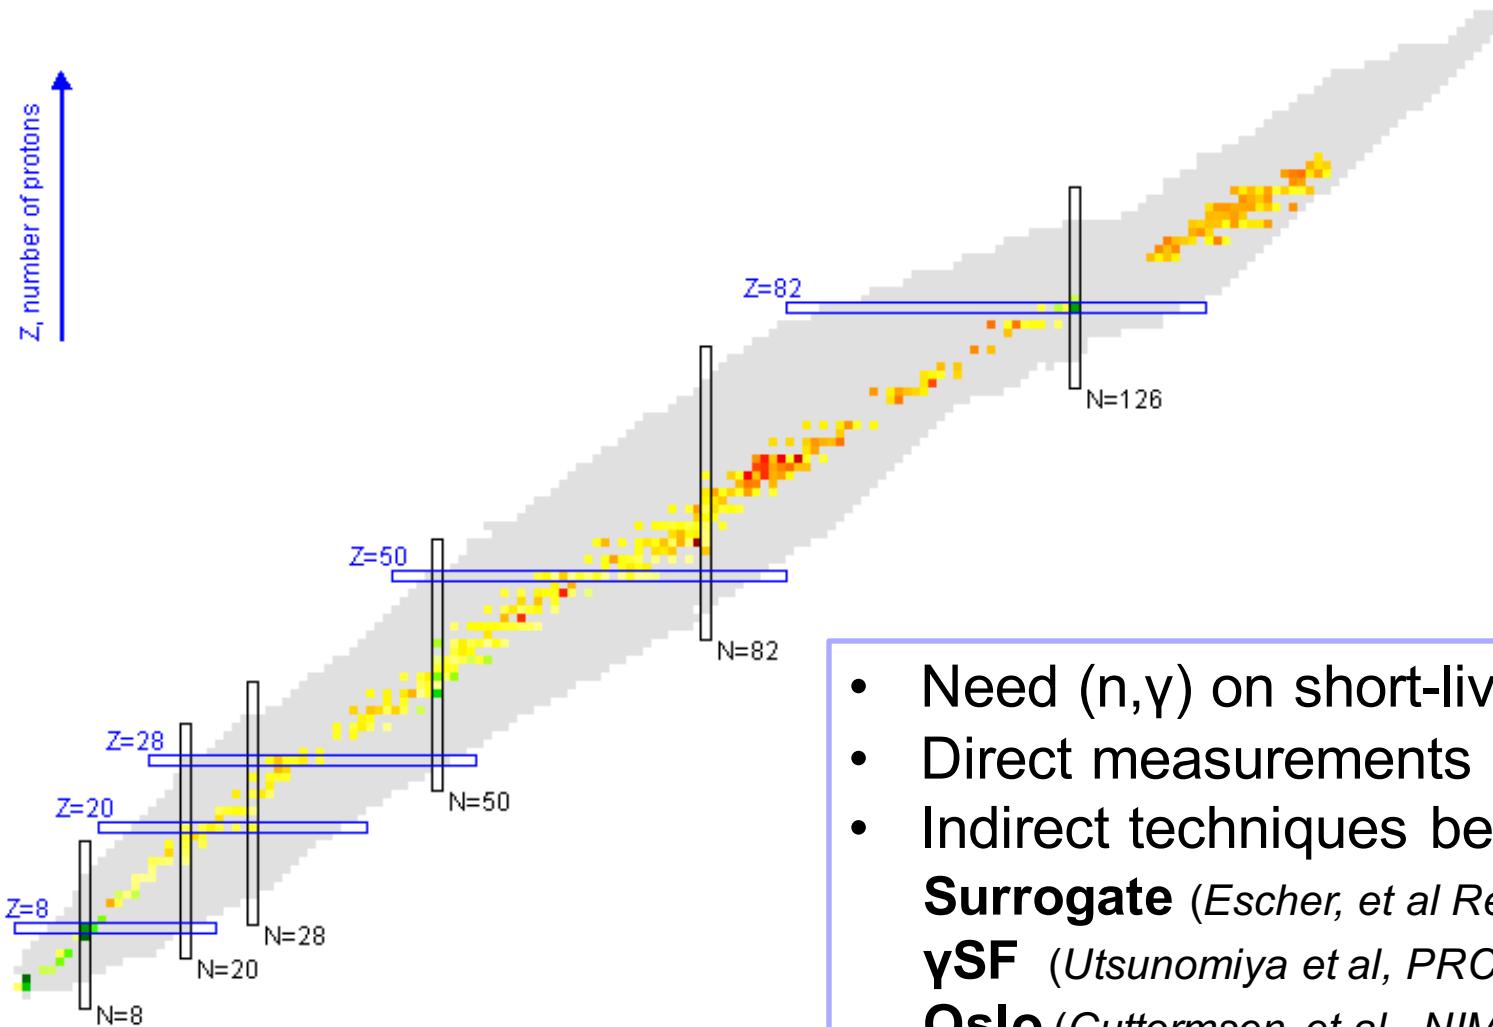

National Science Foundation  
Michigan State University

Surman and Engel PRC (2001)

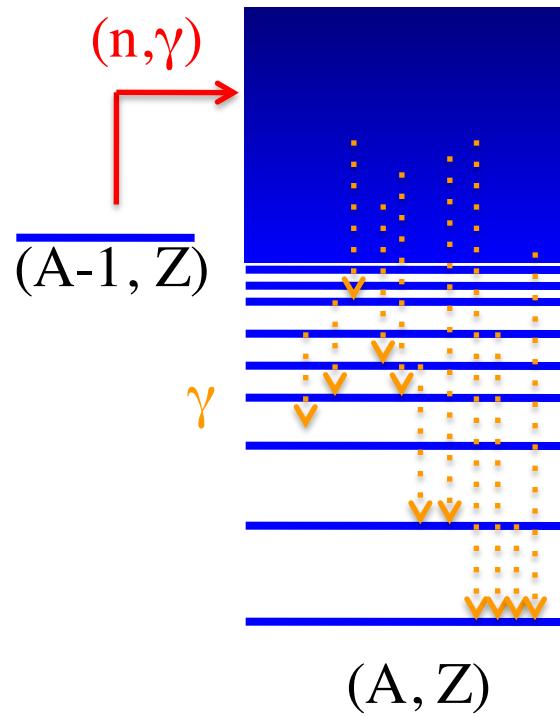

Artemis Spyrou, COMEX 2015, Slide 7

# Current $(n,\gamma)$ measurements

- Need  $(n,\gamma)$  on short-lived nuclei
- Direct measurements challenging
- Indirect techniques being developed:  
**Surrogate** (*Escher, et al Rev. Mod. Phys. 2012*)  
 **$\gamma$ SF** (*Utsunomiya et al, PRC 2010*)  
**Oslo** (*Guttormsen et al., NIMA 1987*)

# Neutron Capture – Uncertainties

## Hauser – Feshbach

- Nuclear Level Density

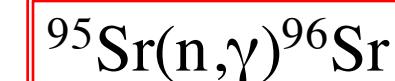

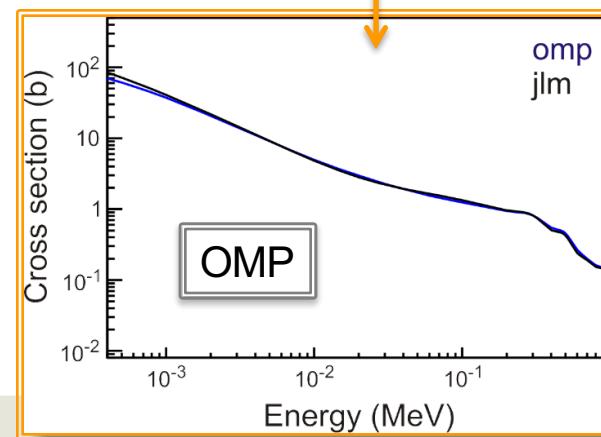

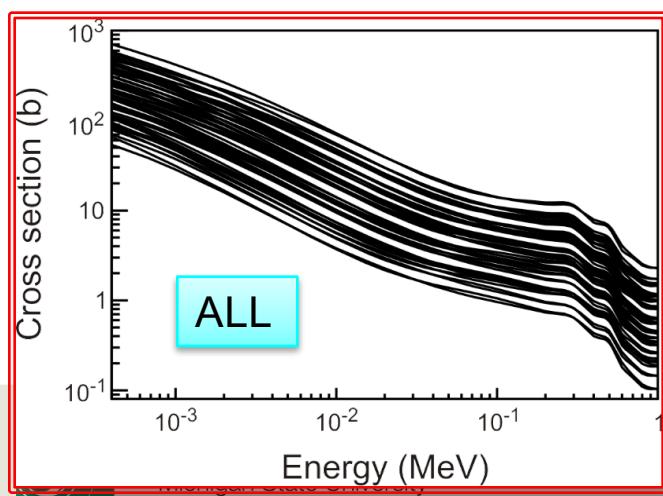

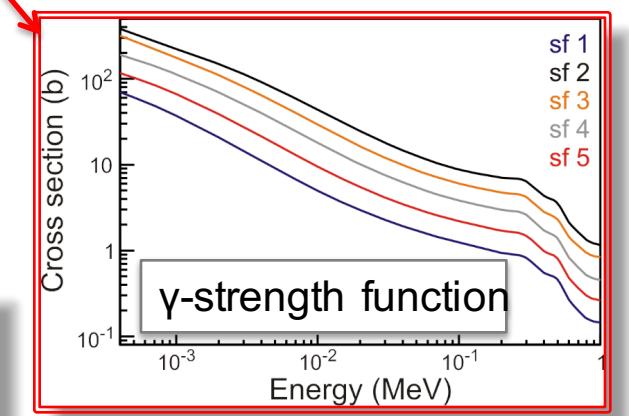

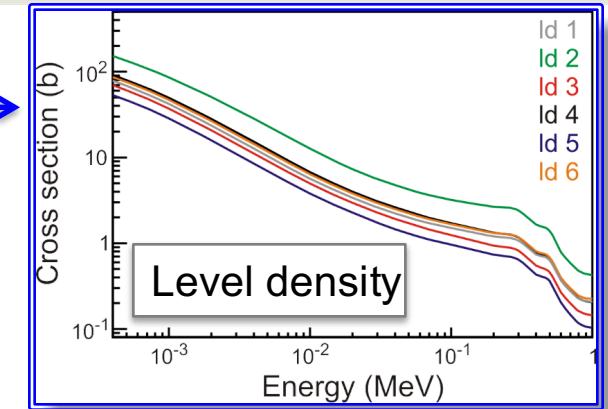

Constant T+Fermi gas, back-shifted Fermi gas, superfluid, microscopic

- $\gamma$ -ray strength function

Generalized Lorentzian, Brink-Axel, various tables

- Optical model potential

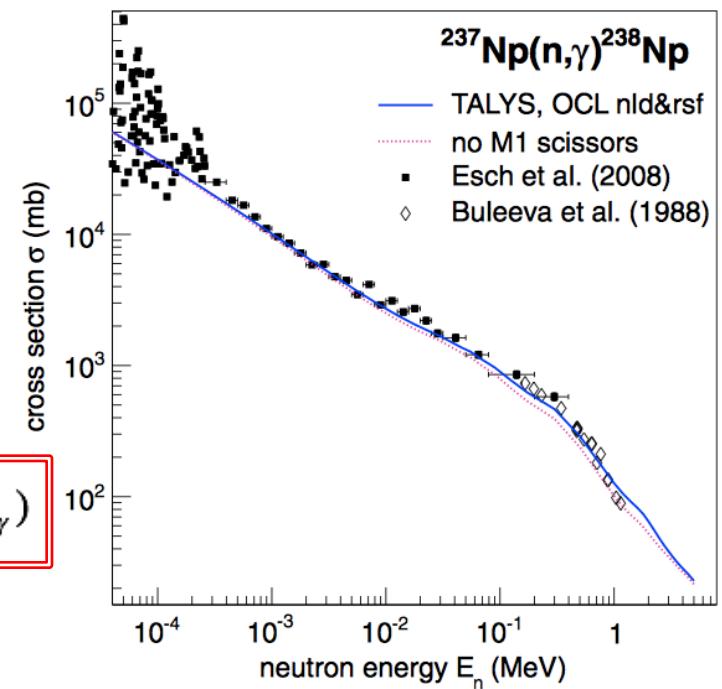

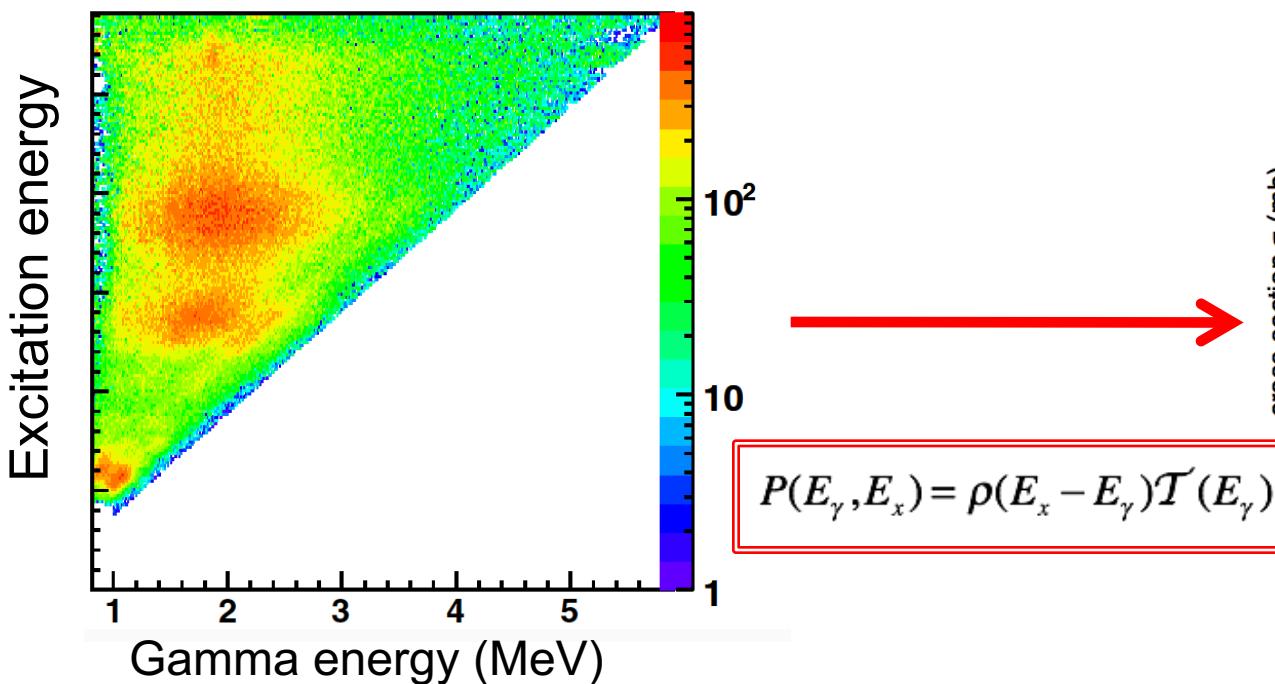

Phenomenological, Semi-microscopic

TALYS

# Traditional Oslo method

- Reaction based
- Applicable close to stability
- Populate the compound nucleus of interest through a transfer or inelastic scattering reaction
- Extract level density and  $\gamma$ -ray strength function
- Calculate “semi-experimental”  $(n,\gamma)$  cross section
- Excellent agreement with measured  $(n,\gamma)$  reaction cross section

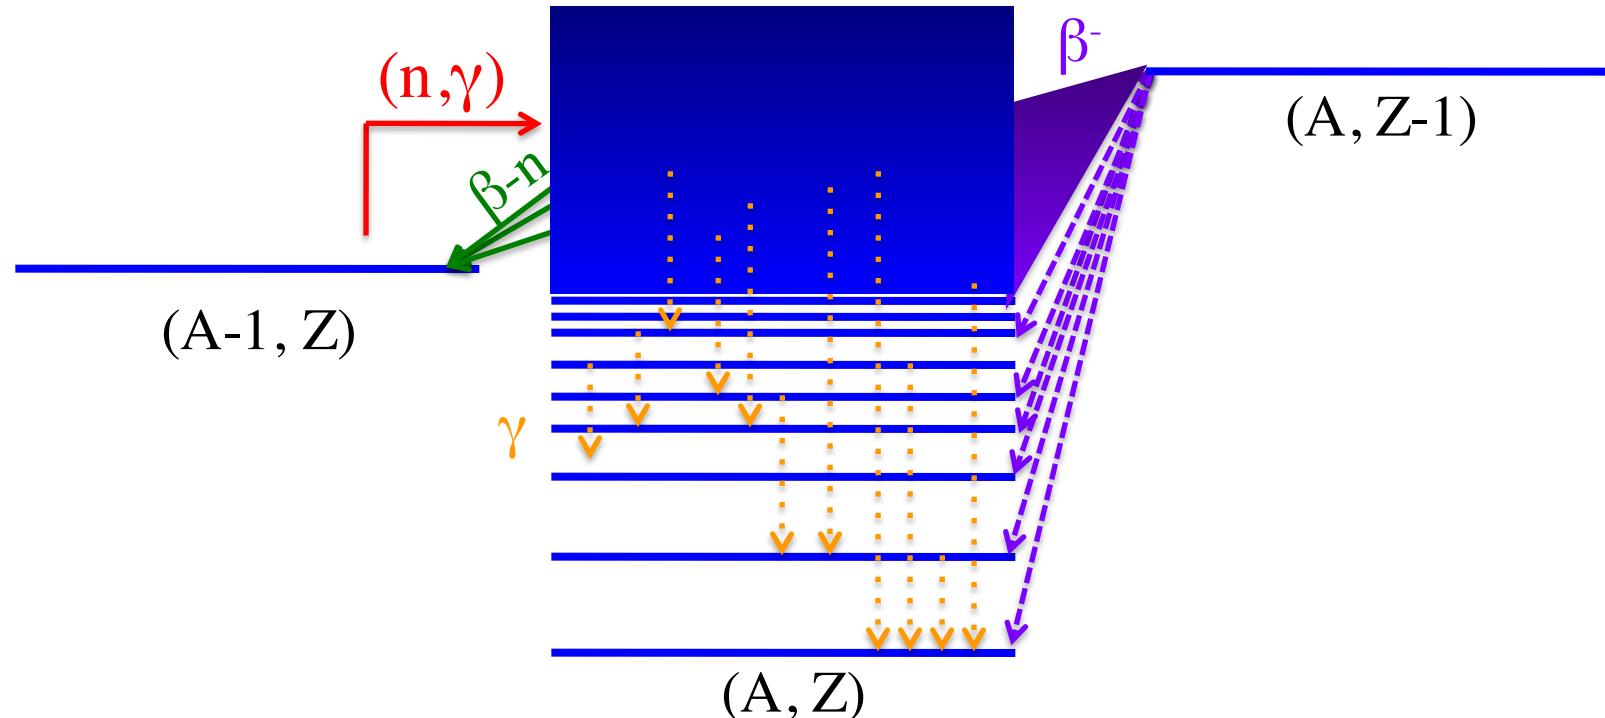

National Science Foundation  
Michigan State University

T.G. Tornyi, M. Guttormsen, et al., PRC2014

Artemis Spyrou, COMEX 2015, Slide 10

# Neutron Capture – $\beta$ -Oslo

- Populate the compound nucleus via  $\beta$ -decay (large Q-value far from stability)
- Spin selectivity – correct for it
- Extract level density and  $\gamma$ -ray strength function
- Advantage: Can reach  $(n, \gamma)$  reactions where beam intensity is 1 pps.

# Summing NaI - SuN

$$E_x = E_{\gamma 1} + E_{\gamma 2} + E_{\gamma 3} + E_{\gamma 4} + \dots$$

- ✓ 16x16 inch
- ✓ 45 mm borehole
- ✓ 2 pieces
- ✓ 8 segments
- ✓ 24 PMTs
- ✓ Efficiency > 85% for 1 MeV

# Proof-of-principle: $^{75}\text{Ge}(\text{n},\gamma)^{76}\text{Ge}$
